

INTEGRATED DISPLAY AND INPUT SYSTEM

Abstract of the Invention

A display and input system 10 provides an enhanced means for displaying service and system information 14 from a system network 18 to a player and to a casino employee. The display and input system 10 enables part or all of a video display screen 40 in a gaming device 50, which had previously been used only as a gaming interface 30, to be utilized as a systems interface 20 for data entry and retrieval of the service and system information 14. This provides a dramatic improvement over traditional system components 60 (input/output peripherals) that have been used as in the past to access service and system information 14 from the system network 18, such as 2-line, 20 character VF displays and 12-digit keypads. The display and input system 10, does not control game play itself (e.g., game play betting, game play flow, or game play operation). Rather, the system 10 provides a limited form of game play monitoring, indirectly, with respect to the monitoring player points.
